04/01/2014	S8 B1	<p>This build transports data for the TIU DOCUMENT DEFINITION (8925.1) file and only includes entries associated to the MATERNITY TRACKER Document Class. The MATERNITY TRACKER Document Class is transported to update the sub-items (maternity titles). The PROGRESS NOTES Class is transported to update the sub-items (maternity document class).</p>	Theodore Fontana
03/27/2014	S7 B6	<p>CORE</p> <p>1. Updates to the DSIO OCNT DIALOGS and DSIO</p>	Theodore Fontana

Date	Revision	Description	Author
		<p>OCNT CONFIGURATION files – data has been added for OB H&P Initial.</p> <p>GUI So it turns out that at some update the ComObject was unable to be installed and this was done when runtime packages were introduced. It was a bad time to find that out but the issue has been corrected and the ComObject can be registered and unregister using the command line. There is no longer a use of runtime packages because it required additional files to be installed on the target system – the libraries now pass a pointer to the broker to eachother.</p> <p>Known Issues/Errors/Bugs 1. The OCNT Vitals section is incomplete – the many components, retrieve and set actions with VistA and the display within a note cannot be easily reproduced without creating a component which will take time. 2. One included Dialog (not used) is Diagnosis Assessment which would have to be converted from ICD9 to ICD10, but it may not be needed because an OCNT doesn't not function without CPRS (CNTs can be run standalone) 3. Currently there is no support for TGroupBox for saving, restoring, or writing to the note 4. No current solution for making dialogs patient centric meaning that data entered in one note can be restored in another. For example: creating a row in the OB Flow Sheet will only be available for that note and no other. 5. Not all fields in a second order dialog are restored. 6. Genetic Screening Dialog – minor UI corrections 7. Physical Exam – minor UI corrections 8. ROS – minor UI corrections 9. ReportCollectionItems are not automagically generated for components placed inside a control (TGroupBox, TPanel) 10. Social Dialog may require additional elements. 11. Family Assessment Dialog requires alteration for multiple diagnoses – this can be accomplished through the additional family member button on the same form, mother and father have been included for the selection so they should be removed from the front page or both should be molded into one. 12. General Exam/Physical Exam elements –</p>	

Date	Revision	Description	Author
		removed from OB Flow Sheet, they will have to be added to another dialog. 13. Assessment and Plan?

Date	Revision	Description	Author
		<p>User Story. We'll need VistA work to complete that story. I think it's a new file and an RPC to save entries.</p> <p>For the RPC, I'd like to be able to save the data using the following parameters.</p> <p>Patient Dfn In/Out Date/Time Creation Date/Time Import/Export Document Type (APHP, APS, APL, APE, MDS, NDS, PPVS, XDR-I) Document Title Sending Facility/Provider Intended Recipient Document Content (XML)</p> <p>Resolution: The RPC saves the 9 input parameters to a file – everything is required. Since there is not much information on exactly what the data is and if it is to be something already on the system there is very little validation and values may be treated as free text instead of pointers. The current design of the file is flat since its use is unknown and since it is flat a key was made with the assumption that a combination of Patient DFN, Date/Time Import/Export, and In/Out would be unique.</p>	
03/12/2014	S7 B2	See DSIO OCNT documentation for initial release.	Theodore Fontana
03/04/2014	S7 B1	MENU CONTEXT: DSIO GUI CONTEXT had TIU GET RECORD TEXT added as an RPC	Theodore Fontana
02/14/2014	S6 B1	<ul style="list-style-type: none"> • RPC: XUS CVC added to the DSIO GUI CONTEXT • RPC: DSIO UPDATE A NOTE <ul style="list-style-type: none"> ○ This will not go to DSIO MAKE ADDENDUM if the user is not allowed to update • RPC: DSIO MAKE ADDENDUM – updated and improved • RPC: DSIO GET RECORD TEXT – The bottom of the return array now lists any addenda. • RPC: DSIO DELETE A NOTE – corrected for failure returns a 0 and 1 for success • RPC: DSIO NOTES BY DFN AND TITLE – Paging has been added and return has changed. The first piece now refers to the list number and there may be several entries with this id – each entry now indicates if it has a linked document. Some notes will be hidden from the user and that's based on TIU 	Theodore Fontana

		"P", "L", and "C" as the first piece of each line	
12/06/2013	S3 B1	<ul style="list-style-type: none"> • ORWPT SELECT is now a part of the DSIO GUI CONTEXT. • Removed sudo flagging, all entries are now required to have an action status set. • Cleaned up the X-REFs and RPCs to work with the updated behavior as stated above. • The DSIO TRACKING SOURCE file now as a new field (SYSTEM) for internal entries used for triggers and the dashboard. System sources are stored in UPPERCASE. • RPC: DSIO CREATE TRACKING LOG now has a fifth parameter (SOR –source). It is not required and will use DASHBOARD as a system source if none is supplied. • The system sources will not show up in the return for RPC: DSIO SELECT LIST. • The DSIO TRACKING HISTORY file will now store the name rather than the pointer for SOURCE and REASON entries to protect from deletes and edits. • Improved and corrected RPC: DSIO GET TRACKING please see DSIO GET TRACKING examples.txt for additional details. • Added the "T" type to RPC: DSIO GET TRACKING to return a list of all currently tracked patients. See above. <p>The build will transport and install data when first being installed at a site.</p>	Theodore Fontana
12/03/2013	S2 B7	<ul style="list-style-type: none"> • RPC: DSIO CREATE TRACKING LOG – corrected the error when setting the status of a patient for the first time. • Input transform on the action field for the Tracking Log now requires the oldest sudo flagged entry to be set before a newer one can be; however, a new log of Start, Stop, Accept, or Reject will bypass this leaving those sudo flagged logs flagged. • A new action X-REF has been created to support the behavior of this field. 	Theodore Fontana
12/02/2013	S2 B6	<ul style="list-style-type: none"> • RPC: DSIO SET TRACKING STATUS removed • FILE: 19641.21 (TRACKING HISTORY) updated to use the EVENT TYPE (ACTION) field • This file has revised X-REFs to aid in the functionality of this field • RPC: DSIO CREATE TRACKING LOG working with the ACTION field <p>Workflows allow for multiple flagged, accept, and</p>	Theodore Fontana

Date	Revision	Description	Author
		<p>reject entries. If tracking has been started then it must stop before it can be started and vice versa. If a log is created as accept, reject, start, or stop after a flagged log then that flagged log will remain as flagged.</p> <p>*Please see the RPC Documentation for this build.</p>	
11/27/2013	S2 B5	<ul style="list-style-type: none"> Added Reminder RPCs to the DSIO GUI CONTEXT – like Alerts and Progress Notes some of these will later be removed from this context Added a new field to the DSIO TRACKING HISTORY file - .06 Action (Event Type) which is a Set of Codes type (0:STOP,1:START,2:FLAG,3:REJECT,4:ACCEPT) A action X-Ref as created to support the behavior of this field New RPC: DSIO CREATE TRACKING LOG – this is much like DSIO SET TRACKING STATUS except the input parameter STAT is ACT. <p>SETS THE TRACKING STATUS OF A PATIENT FROM A TRACKING HISTORY LOG THE SYSTEM THEN CREATES ANOTHER LOG INDICATING THAT THE TRACKING STATUS OF A PATIENT HAS CHANGED.</p> <p>Start, Stop, Flag, Accept(does nothing), Reject(does nothing)</p> <p>The first three will change the current tracking status of a patient with Start being Yes (Patient is being tracked), Stop being No (Patient is not being tracked), and Flag being Flagged (Patient is Flagged).</p> <p>This is an editable field therefore, if the user changes an earlier entry's action status it will still change the status of the Patient.</p>	Theodore Fontana
11/26/2013	S2 B4	<ul style="list-style-type: none"> RPC: DSIO PATIENT SEARCH now accounts for sensitive patients RPC DSIO GET TRACKING has been renamed to DSIO SET TRACKING STATUS RPC DSIO SET TRACKING STATUS will not validate both internally and externally the STAT input parameter RPCs have been registered to the DISO GUI CONTEXT to support Sensitive Patients, Alerts, and Progress Notes 	Theodore Fontana

Date	Revision	Description	Author
11/22/2013	S2 B3	<ul style="list-style-type: none"> RPC: DSIO TRACKING RECORD will no longer return system messages unless it is a critical failure otherwise success is 1^SUCCESS. You can now add reason that don't already exist in the reason file. Proper case is used to add new entries thus "TEST" and "Test" and everything in-between are different entries. RPC: DSIO GET TRACKING is a return of a global array the wrapping flag is now set to true – it will not return a single line. The Date Time format has changed to MM/DD/YYYY@HH:MM:SS The currently tracking status is now returned as 0, 1, or 2 RPC: DSIO PATIENT SEARCH now returns currently tracking status as 0, 1, or 2 RPC: DSIO SELECT LIST can now add and delete entries. This RPC will always return a list unless an error is encountered. Proper case applies. The TRACKING DATE, PATIENT, TRACKING STATUS, and USER for Tracking Logs are now uneditable fields. <p>This build will no longer include data.</p>	Theodore Fontana
11/21/2013	S2 B2	<ul style="list-style-type: none"> Removed bad entries from the DSIO TRACKING SOURC/REASON files. RPC: DSIO SELECT LIST can now delete an entry/input parameters have changed RPC: DSIO TRACKING RECORD is no longer set to only set the tracking status of a patient to yes. Thus status is required. Input parameters have changed. There was an error when the patient didn't already exist in the DSIO Patient file – the patient entry will now be created. Returned messages are now in proper case. RPC: DSIO GET TRACKING will now sort in descending order. New and cleaned up X-References. Now supports Currently Flagged Entries for a Patient and All Currently Flagged Entries for all Currently Flagged Patients. Changed field names between files for consistency. <p>**See RPC Documentation at the end of the document.</p>	Theodore Fontana
11/19/2013	S2 B1	Please see components and RPC documentation at the end of this document. This build will also remove the Sprint 1 builds that were incorrectly namespaced – they have been replaced.	Theodore Fontana

Components

Files			
	DSIO PATIENT	19641	Additional patient centric data elements not already part of VistA.
	DSIO NON-VA ENTITIES	19641.1	Providers and facilities not belonging to the VA.
	DSIO PERSONS	19641.11	Stores people related to the patient without marriage or a dependency related nature.
	DSIO TRACKING HISTORY	19641.2	A list of dated records for use with the MCC dashboard by to track, stop tracking, or flag a patient for tracking.
	DSIO TRACKING SOURCE	19641.22	The application that is creating the tracking log.
	DSIO TRACKING REASON	19641.23	A listing of reasons why a patient is being or flagged for tracking.
	DSIO CPRS PROBLEM	19641.31	
	DSIO LAB TEST	19641.33	
	DSIO NOTE CONTROL	19641.4	A listing of TIU Document Titles and Reminder Dialogs that will allow discreet data to be saved. It also holds any M Code to execute for data elements that need additional processing outside of DDCS.
	DSIO NOTE DATA	19641.41	This file links DSIO NOTE S, M, and WP discreet data entries to the TIU Document.
	DSIO NOTE S	19641.43	This is a single valued discreet data entry.
	DSIO NOTE M	19641.44	This is a multi-valued discreet data entry.
	DSIO NOTE WP	19641.45	This is a word processing type discreet data entry.
	DSIO OCNT CONFIGURATION	19641.48	This file contains startup data for an OCNT by TIU Document Title.
	DSIO OCNT DIALOGS	19641.49	This file contains the Delphi data needed to create an OCNT dialog form and its startup data.
	DSIO TITLE CONFIGURATION	19641.5	This file contains visit

			information required to create TIU Documents through the MCC Dashboard.
	DSIO IHE DOCUMENT	19641.6	This file stores the IHE Documents.
	DSIO IHE DOCUMENT TYPE	19641.61	This file stores the IHE Document types.

Routines

ARCHITECTURE

oCNT WITH DDCS

RPC

1. The TIU Document's Title/Reminder Dialog is controlled.

2. Passed 1, save the TIU Document to DSIO NOTE DATA and the elements to S, M, WP and link them back

3. A data element has been matched with the TIU Document Title data entry - Execute the M Code.

OCNT with DDCS

The DSIO oCNTs can only be run through the CPRS TIU Note ComObject functionality and so cannot run standalone nor can they access VistA without it being through CPRS. The OCNT uses ICPRSBroker which is set up in CPRSNoteCOM.dll using uExtndComBroker.pass to behave like ORNet before it is passed to the called OCNT. Before it is passed to the called OCNT the ComObject will use it to retrieve the OCNT root path using the RPC DSIO OCNT GET LOCATION which uses the parameter DSIO OCNT LOCATION. Once it has this value it will concatenate it with the passed value to find and launch the called OCNT.

Once an OCNT is launched the OCNT will loop through all of its owned components and use the RPC - DSIO OCNT POPULATE to lookup any of these components by name and TIU Document IEN which in turn is used to check the DSIO OCNT CONFIGURATION file to look under for the TIU Document Title and if in the file will check if the component name also exists and if so, will retrieve any associated value(s). If the RPC returns a value it will be used to set the component. The idea here is to allow OCNT selection type components to be changed by a site by site basis without the need for redevelopment. This same functionality is performed by DSIO OCNT DIALOG POPULATE when a dialog is opened but uses the DSIO OCNT DIALOGS file.

When an OCNT is closed, finished, or saved it will loop through all of its ReportCollection Items and build an array and once finished it will pass this array to VistA using the RPC - DSIO OCNT STORE which will then save the data associated by component and TIU Document discreetly. The APIs and files used for this process is part of the DSIO - DDCS (Discreet Data Control and Storage) package; for more information please refer to the DSIO_DDCS.pdf document. Likewise, when an OCNT dialog is OK'ed it will loop through all of its owned components and will use the same RPC to store all of its components and their values discreetly.

DDCS

Saving data discreetly using this system means saving the name of individual elements or what they intend to represent along with their data associated to a TIU Document. In order to use this there must be a TIU Document created with a title that exists within the DSIO NOTE CONTROL file or you must be running a Reminder Dialog in CPRS when that Reminder Dialog has been added to the DSIO NOTE CONTROL file. Both the Reminder Dialog and the TIU Document (either by an OCNT or DSIO TIU Support RPC) use the RPC - DSIO OCNT STORE.

DSIO OCNT STORE takes the TIU Document IEN as the first parameter as saves the elements to DSIO NOTE S, M, or WP depending on the type of component and links them to DSIO NOTE DATA under the TIU Document. DSIO NOTE CONTROL allows the process to occur while matching any element that is passed in its DATA multiple and executes stored M code upon finding a match associated to a TIU Document Title.

CORE

Beyond the DDCS and the OCNT blocks the DSIO CORE consists of the DSIO PATIENT file which is DSIO's center when extending VistA with patient specific information. DSIO PERSONS is pointed to by DSIO PATIENT to extend the patient's relations where the PATIENT RELATION and INCOME PERSON file would be inappropriate. One such example is the DSIO's need for a Father of Fetus but such a relationship does not imply marriage (the space RELATIONSHIP) nor does it imply dependency which is the main use of the PATIENT RELATION file. DSIO PATIENT also has a TRACKING STATUS field whose value is determined by entries in the DSIO TRACKING HISTORY file which points to the DSIO TRACKING SOURCE and DSIO TRACKING REASON files – this two additional tracking type files merely provide more flexibility than a set of codes field type would allow.

DSIO TITLE CONFIGURATION allows for DSIO TIU Supported type RPCs to create TIU Documents without requiring the user to select a visit each time. This functionality is only intended for use with DSIO TIU Document Titles used in the Maternity Tracker Dashboard. Such notes are Event or telecommunication service type notes. The DSIO CREATE A NOTE RPC will not create a note unless the title exists in this file and appropriate visit information has been configured.

DSIO NON-VA ENTITIES covers the storage of both facilities and providers not related to the VA.

DSIO IHE DOCUMENT covers the storage of IHE documents and the information related to their import or export, patient centric, and requiring a unique GUID across the file. DSIO IHE DOCUMENT TYPE is used to provide greater flexibility than a set of codes field type would allow. These XML based documents are created from VistA using the Maternity Tracker Dashboard with the use of DSIO VPR

APIs

\$\$NAME^DSIO2

Reference Type

Category GENERAL

Description This API transforms a patient's name as it is in the .01 field of the patient file (LASTNAME,FIRSTNAME MI) to title case (Lastname,Firstname MI).

Format \$\$NAME^DSIO2 (NAM)

Input Parameters NAM: The patient's name as it appears in the .01 field of the patient file.

NAME^DSIO2(NAM) — Example

```
VAH>W $P(^DPT(8,0),U)
AYS,SHTS
VAH>W $$NAME^DSIO2($P(^DPT(8,0),U))
Ays,Shts
```

\$\$DT^DSIO2

Reference Type

Category GENERAL

Description This API transforms an external Date/Time to FileMan DT.

Format \$\$DT^DSIO2 (VAL)

Input Parameters VAL: This is a date/Time value originally intended for use with formats not compatible with DT^DILF but has been extended to use this API as well.

NAME^DSIO2(NAM) — Example

```
VAH>W $$DT^DSIO2("9/23/2004 10:53:25 AM")
3040923.105325
VAH>W $$DT^DSIO2("2009-10-22 05:00:00.0")
3091022.05
```

Remote Procedure Calls

Categories

NOTES	Unlike many other RPCs for DSIO a failure results in a 0 rather than a -1.
TRACKING	
OCNT	Please refer to OCNT documentation.
DDCS	Please refer to DDCS documentation.
IHE	

DSIO FEMALE PATIENT SEARCH

Reference Type

Category GENERAL

Description The purpose of this RPC is to provide a GUI with a listing of female patients. Due to the nature of the KEY input parameter it can also be used to find a patient or a set of patients by name.

Format PATIENT2^DSIO1(.RET,KEY, SORT)

Input Parameters

KEY: This is a string of text representing patient names starting with their last name to their first name INCLUDING the comma (,) in between. It can be one character to a full name.

SORT: This input parameter must be formatted as PAGE#,COUNT# (the comma is required). The COUNT portion of this parameter will control how many entries in the list will be returned and the PAGE portion will identify the increment by COUNT of the entries returned. Thus if there are 4 entries, a SORT of 1,2 will be entries 1 and 2 and 2,2 will return entries 3 and 4.

Output GLOBAL ARRAY

Success Multi Lines of:

The zero node will return the total number of entries returned.

DFN ^ LASTNAME,FIRSTNAME ^ SSN(LAST 4) ^
 DATE OF BIRTH ^ VETERAN STATUS ^
 LOCATION(WARD) ^ ROOM/BED^SERVICE
 CONNECTED ^ CURRENTLY TRACKING ^ SSN ^
 CITY ^ STATE ^ ZIP

Failure -1^Patient(s) not found.

PATIENT2^DSIO1(.RET,KEY,SORT) — Example

```
VAH>D PATIENT2^DSIO1(.RET,"A") ZW @RET
^TMP(13268,"DSIO PATIENT",0)=3
^TMP(13268,"DSIO PATIENT",1)="751^Acmpatient,One^0939^9/19/1939^YES^7B^^NO^2^666

VAH>D PATIENT2^DSIO1(.RET,"dkjfkdkjfkjdfjdkfj") ZW @RET
^TMP(20708,"DSIO PATIENT",0)="-1^Patient(s) not found."
```

DSIO FEMALE PATIENT FIND

Reference Type

Category GENERAL

Description The purpose of this RPC is to try to find a specific patient either by their SSN, last four, or the first letter of their last name plus their last four. There is still a possibility to find more than one patient but the list will be much narrower than DSIO FEMALE PATIENT SEARCH.

Format PATIENT1^DSIO1(.RET,KEY)

Input Parameters KEY: This can be either a set of 4 or 9 number as an SSN in a ###-##-#### format or as a letter + #####.

Output ARRAY

Success	Multi Lines of: DFN ^ LASTNAME,FIRSTNAME ^ SSN(LAST 4) ^ DATE OF BIRTH ^ VETERAN STATUS ^ LOCATION(WARD) ^ ROOM/BED ^ SERVICE CONNECTED ^ CURRENTLY TRACKING
Failure	-1^Patient not found.

PATIENT1^DSIO1(.RET,KEY) — Example

```

VAH>D PATIENT1^DSIO1(.RET,666660939) ZW RET
RET(0)="751^Acmpatient,One^0939^9/19/1939^YES^7B^^NO^2"

VAH>D PATIENT1^DSIO1(.RET,"666-66-0939") ZW RET
RET(0)="751^Acmpatient,One^0939^9/19/1939^YES^7B^^NO^2"

VAH>D PATIENT1^DSIO1(.RET,"A0939") ZW RET
RET(0)="751^Acmpatient,One^0939^9/19/1939^YES^7B^^NO^2"

VAH>D PATIENT1^DSIO1(.RET,0930) ZW RET
RET(0)="-1^Patient not found."

```

DSIO GET SINGLE VALUE

Reference Type

Category GENERAL

Description This RPC will return the value stored in the NEXT CONTACT DATE field of DSIO PATIENT, the institution, or the FATHER OF FETUS of the current Pregnancy from the DSIO PATIENT file.

Format GET^DSIO4 (.RET, DFN, ITEM)

Input Parameters

DFN: Patient Internal Entry Number

ITEM: The value to retrieve (“NEXT CONTACT DATE”, “INSTITUTION”, “FATHER OF FETUS”)

Output SINGLE VALUE

Success	Value
	INSTITUTION:
	IEN ^ NAME ^ LATESTDATE ^ DOMAIN ^ STREET1 ^ STREET2 ^ CITY ^ STATE ^ ZIP ^ HOMESITE
	FATHER OF FETUS:
	IEN ^ NAME ^ STREET1 ^ STREET2 ^ STREET3 ^ CITY ^ STATE ^ ZIP ^ PHONE

GET^DSIO4(.RET,DFN,ITEM) — Example

```
VAH>K RET D GET^DSIO4(.RET,8,"NEXT CONTACT DATE") ZW RET
RET="DEC 12, 2014"
```

```
VAH>K RET D GET^DSIO4(.RET,8,"INSTITUTION") ZW RET
RET="500^VAMC ALBANY^3140422^SMA.FO-ALBANY.MED.VA.GOV^VA MEDICAL CENTER^1 3RD st
.^ALBANY^NEW YORK^12180-0097"
```

```
VAH>K RET D GET^DSIO4(.RET,8,"FATHER OF FETUS") ZW RET
RET="4^Blah,Blah Father Of Fetus^^^^^^"
```

DSIO SAVE NON VA ENTITY

Reference Type

Category GENERAL

Description This RPC will create or edit an entry in the DSIO NON-VA ENTITIES file.

Format SENT^DSIO4(.RET,.SAVE)

Input Parameters **SAVE:** This is a list of caret delimited values with the first piece as the field and the second piece as the value. Only in the case of the NAME field is a third piece accepted and that is the change the value of NAME. Setting any of these pieces without a value will delete the current value for that field.

DSIO RETURN ENTITY

Reference Type

Category GENERAL

Description This RPC will return a list of entries from the DSIO NON-VA ENTITIES file. When TYP is set to “F” only facilities will be returned, for “P” only providers, and when TYP is a number or a name it will return the record for that entry only.

Format RENT^DSIO4 (.RET, TYP)

Input Parameters

TYP: This input parameter will narrow the return list – “F”: Facilities, “P”: Providers, # or NAME for a single entry, or null for all entries.

SORT: This input parameter must be formatted as PAGE#,COUNT# (the comma is required). The COUNT portion of this parameter will control how many entries in the list will be returned and the PAGE portion will identify the increment by COUNT of the entries returned. Thus if there are 4 entries, a SORT of 1,2 will be entries 1 and 2 and 2,2 will return entries 3 and 4.

Output

Success Multi Lines of:

The zero node will return the total number of entries returned.

IEN ^ NAME ^ TYPE ^ INACTIVE ^ PRIMARY

DSIO SELECT LIST

Reference Type

Category GENERAL

Description This RPC will return a list of entries, add an entry, or delete an entry from the DSIO TRACKING REASON or DSIO TRACKING SOURCE files.

Format SELECT^DSIO1 (.RET, TYP)

Input Parameters TYP: When this input parameter is set to “S” it will return a list of entries that are not marked as system from the DSIO TRACKING SOURCE file; likewise, it will do the same for the DSIO TRACKING REASON file when it is set to “R”.

To add an entry:

(S or R)^ENTRY NAME^A

To delete an entry:

(S or R)^ENTRY NAME^D

Output ARRAY

Success Multi Lines of the entry name.

Failure -1^ERROR MESSAGE

SELECT^DSIO1(.RET,TYP) — Example

```
VAH>K RET D SELECT^DSIO1(.RET,"S") ZW RET  
RET(0)="-1^No entries."
```

```
VAH>K RET D SELECT^DSIO1(.RET,"R") ZW RET  
RET(0)="Other"  
RET(1)="Postpartum/lactation"  
RET(2)="Pregnant"  
RET(3)="Problem List Pregnant"  
RET(4)="Rec Test"  
RET(5)="Test"
```

```
VAH>K RET D SELECT^DSIO1(.RET,"S^SOURCE^A") ZW RET  
RET(0)="Source"
```

```
VAH>K RET D SELECT^DSIO1(.RET,"R^TEST^D") ZW RET  
RET(0)="Other"  
RET(1)="Postpartum/lactation"  
RET(2)="Pregnant"  
RET(3)="Problem List Pregnant"  
RET(4)="Rec Test"
```

DSIO CREATE TRACKING LOG

Reference Type

Category TRACKING

Description This RPC creates a tracking log in the DSIO TRACKING HISTORY file. The ACTION(.02) used to create the entry may or may not change the status of the patient depending on their current TRACKING STATUS(.02) within the DSIO PATIENT file.

Format REC^DSIO1 (.RET, DFN, ACT, RES, .COM, SOR)

Input Parameters

DFN: Patient Internal Entry Number

ACT: This action represents the purpose of the entry and potentially the status of the patient.

'0' FOR STOP
'1' FOR START
'2' FOR FLAG
'3' FOR REJECT
'4' FOR ACCEPT

RES: A caret delimited string of human readable reasons as to why this tracking entry is being created. These reasons are also saved in the DSIO TRACKING REASON file.

RES="REASON 1^REASON 2"

COM: A list of formatted lines that will be identified as a comment and placed in a word processing field (COMMENT(2)) of the DSIO TRACKING HISTORY file. This is a simple numbered list.

COM(0)="This would be the first line of the comment."

SOR: This is the source or origin of the tracking entry. Some of the system entries are "DASHBOARD" and "FILEMAN". These entries are saved in the DSIO TRACKING SOURCE file.

Output SINGLE VALUE

Success

1^SUCCESS

Failure

-1^ERROR MESSAGE

Note

When the Patient's TRACKING STATUS is:

0 – NO = No, the patient is not being tracked.

When the patient's tracking status is NO and a tracking entry of START is created the patient's status will become YES.

Likewise, if a tracking entry of FLAG were to be created the patient's tracking status would become FLAG.

Additionally, but not necessary, if an entry of STOP was created the tracking status would be set to NO.

1 – YES = Yes, the patient is being tracked.

When the patient's tracking status is YES a tracking entry of NO will change their status to NO. FLAG entries do not change the status of the patient when their status is YES; however, if a FLAG entry were to be rejected it would change the status of the patient to NO.

2 – FLAG = Please review, this patient may need to be tracked.

If a patient is set as FLAG then a tracking entry of ACCEPT will YES their status while a REJECT will NO their status.

Likewise, but not necessary, an entry of START or STOP will change their status to YES or NO respectively.

DSIO GET TRACKING

Reference Type

Category TRACKING

Description This RPC will return a list of all tracking history entries, all currently tracked patients, all currently flagged patients, all entries for a patient, or all currently flagged entries for a patient.

Format TRCLIST^DSIO1(.RET,TYP, SORT)

Input Parameters

TYP: Note (TIU DOCUMENT) internal entry number.

SORT: This input parameter must be formatted as PAGE#,COUNT# (the comma is required). The COUNT portion of this parameter will control how many entries in the list will be returned and the PAGE portion will identify the increment by COUNT of the entries returned. Thus if there are 4 entries, a SORT of 1,2 will be entries 1 and 2 and 2,2 will return entries 3 and 4.

Output**GLOBAL ARRAY**

Success

A list of entries when (in all cases the first piece is the identifier with “L” = Log (the second piece will then be the IENS of the historical entry), “C” = Comment, “P” = Patient (the second piece will then be the DFN of the patient).

TYP = (“”,ALL), DFN, “F”+DFN

Get all logs, Get all logs for a patient, Get currently flagged entries for a patient:

L ^ IENS ^ TRACKING DT(E) ^ DFN ^
 LASTNAME,FIRSTNAME ^ USER ^ ACTION ^
 SOURCE ^ REASON|REASON

C ^ IENS ^ COMMENT

TYP = “T”

Get all currently tracked patients:

P ^ DFN ^ LASTNAME,FIRSTNAME ^ LAST 4 ^ DOB
 ^ PHONE ^ EDD

TYP = “F”

Get all currently flagged patients:

P ^ DFN ^ LASTNAME,FIRSTNAME ^ LAST 4 ^ DOB
 ^ PHONE ^ REASON

Failure

-1^No entries found.

DSIO CREATE A NOTE

Reference Type

Category NOTES

Description This RPC creates a TIU Document and saves discreet data passed in through its fourth input parameter. The data is associated with the note and can be later retrieved simply by using the note IEN. This RPC uses TIU APIs and condenses many of them into one call which includes authentication, locking, and unlocking.

Format `CREATE^DSIO3(.RET,DFN,TITLE,.NOTE,.DATA,SUBJ)`

Input Parameters

DFN: Patient Internal Entry Number

TITLE: The name of the entry to the TIU DOCUMENT DEFINITION file (8925.1) whose TYPE(.04) is TITLE.

NOTE: A list of formatted lines that will be placed in the body of the note. This is a simple numbered list.
NOTE(0)="This would be the first line of the note."

DATA: A list of values to be saved discreetly and associated to the identified note. Each entry in this list consists of four pieces delimited by caret – TYPE^ID^FIELD^VALUE.
Where TYPE = S, M, WP which means single, multiple, and word processing.
ID is a unique number that associates multiple entries of the list to belong to one entry for VistA.
FIELD is the name of the caption or label that identifies the VALUE which is the fourth piece of a list entry.
DATA(0)="S^^LABEL 1^SOME VALUE"
DATA(1)="S^^LABEL 2^SOME OTHER VALUE"
DATA(2)="M^1^M LABEL^VALUE 1"
DATA(3)="M^1^M LABEL^VALUE 2"
DATA(4)="WP^2^WP LABEL^THIS TYPE IS USED MORE FOR A FIELD THAT"
DATA(5)="WP^2^WP LABEL^CONTAINS A LOT OF TEXT THAT'S MEANT TO BE READ"
DATA(6)="WP^2^WP LABEL^TOGETHER."

SUBJ: The note subject (optional) – this is not the title.

Output**SINGLE VALUE**

Success

NOTE IEN^1^1

NOTE IEN = The TIU DOCUMENT
IEN1^1 = the page number and total
number of pages of the Note

Failure

0^ERROR MESSAGE

DSIO UPDATE A NOTE

Reference Type

Category NOTES

Description This RPC is used to update the body of a TIU document which requires TIU Authentication and if it passes it uses ADDEND. Thus in most cases the note must be signed in order to be updated.

Format SET^DSIO3 (.RET, IEN, .NOTE, .DATA, SUBJ)

Input Parameters

IEN: Note (TIU DOCUMENT) internal entry number.

NOTE: A list of formatted lines that will be placed in the body of the note. This is a simple numbered list.
NOTE(0)="This would be the first line of the note."

DATA: A list of values to be saved discreetly and associated to the identified note. Each entry in this list consists of four pieces delimited by caret – TYPE^ID^FIELD^VALUE.
Where TYPE = S, M, WP which means single, multiple, and word processing.
ID is a unique number that associates multiple entries of the list to belong to one entry for VistA.
FIELD is the name of the caption or label that identifies the VALUE which is the fourth piece of a list entry.
DATA(0)="S^^LABEL 1^SOME VALUE"
DATA(1)="S^^LABEL 2^SOME OTHER VALUE"
DATA(2)="M^1^M LABEL^VALUE 1"
DATA(3)="M^1^M LABEL^VALUE 2"
DATA(4)="WP^2^WP LABEL^THIS TYPE IS USED MORE FOR A FIELD THAT"
DATA(5)="WP^2^WP LABEL^CONTAINS A LOT OF TEXT THAT'S MEANT TO BE READ"
DATA(6)="WP^2^WP LABEL^TOGETHER."

SUBJ: The note subject (optional) – this is not the title.

Output

SINGLE VALUE

Success	IEN ^ LAST PAGE ^ TOTAL PAGES
Failure	0^ERROR MESSAGE

DSIO DELETE A NOTE

Reference Type

Category NOTES

Description This RPC allows a user to attempt to delete a note which must first pass TIU Authentication. Running this RPC without using the optional parameter, JUST, could fail the delete if TIU Authentication asks for it and so, must then be called again with justification.

Format DELETE^DSIO3 (.RET, IEN, JUST)

Input Parameters

IEN:	Note (TIU DOCUMENT) internal entry number.
JUST:	This is just a string of text that will be saved off as the reason as to why the user needs to delete the note.

Output SINGLE VALUE

Success	1^SUCCESS
Failure	-1^ERROR MESSAGE

DELETE^DSIO3(.RET,IEN,JUST) — Example

```
VAH>D DELETE^DSIO3(.RET,5179) ZW RET
RET=1
```

```
VAH>D GET^DSIO3(.RET,5179) ZW @RET
^TMP("DSIO TIUVIEW",10360,0)=0
```

DSIO GET RECORD TEXT

Reference Type

Category NOTES

Description This RPC will return the TIU Document with any discreet data appended below the note separated by a line of dashes and a header.

Format GET^DSIO3 (.RET, IEN, TYP)

Input Parameters

IEN: Note (TIU DOCUMENT) internal entry number.

TYP: Pass null for whole note with discreet data and addenda, “H” to return the header only, or “B” to return the body only.

Output

GLOBAL ARRAY

Success	<p>If null then return a list of formatted lines representing the TIU Document, discreet data (if any), and addenda (if any). In both cases there is a separator; however, if there is no data then the separator will not be included.</p> <p>If “H” then return a list of formatted lines representing the TIU Document with just the header.</p> <p>If “B” then return a list of formatted lines representing the TIU Document with just the body of the note.</p>
Failure	0

DSIO NOTES BY DFN AND TITLE

Reference Type

Category NOTES

Description This RPC will return a list of notes along with identifying information that use the passed note titled for the identified patient.

Format LIST^DSIO3(.RET, DFN, TITLE, SORT)

Input Parameters

DFN: Patient Internal Entry Number

TITLE: The name of the entry to the TIU DOCUMENT DEFINITION file (8925.1) whose TYPE(.04) is TITLE.

SORT: This input parameter must be formatted as PAGE#,COUNT# (the comma is required). The COUNT portion of this parameter will control how many entries in the list will be returned and the PAGE portion will identify the increment by COUNT of the entries returned. Thus if there are 4 entries, a SORT of 1,2 will be entries 1 and 2 and 2,2 will return entries 3 and 4.

Output

Success GLOBAL ARRAY

Multi Lines of:

The zero node will return the total number of entries returned.

LIST ITEM ^ IEN ^ SUBJECT(1701) ^ STATUS(.05) ^
ENTRY DATE/TIME(1201) ^

DSIO VPR GET PATIENT DATA

Reference Type

Category IHE

Description This RPC retrieves the requested data from VistA, and returns it in ^TMP("VPR",\$J,n) as XML.

Format GET^DSIO3V1 (.VPR,DFN,TYPE,START,STOP,MAX,ID,FILTER)

Input Parameters

DFN: Patient Internal Entry Number.

TYPE: The kind(s) of data to return, which may include: accession, allerg, appointment, clinicalproc, consult, demograph, document, factor, flag, immunization, skin, exam<>, educat, insur, polic, lab, panel, med, pharm, observ, order, patient, problem, procedure, reaction, surg, visit, vital, rad, xray, new, author, family, providers

START: The date/time from which to begin searching for data [optional].

STOP: The date/time at which to end searching for data [optional].

MAX: The maximum number of items to return per data type [optional].

ID: The identifier of a single item to return [optional, but TYPE must also be defined when used].

FILTER: List of name-value pairs, further refining the search.

Output

GLOBAL ARRAY	
Success	Text array formatted as XML
Failure	Text array formatted as XML

DSIO IHE SAVE

Reference Type

Category IHE

Description This RPC will save an IHE Document and the information about it – data is validated before saving so there cannot be partial saves.

Format `SAVE^DSIO3A(.RET, GUID, DFN, DIRECT, DTC, DTIE, DTYE, TITLE, FAC, REC, DOC)`

Input Parameters **GUID:** GUIDs identify objects such as interfaces, manager entry-point vectors (EPVs), and class objects. A GUID is a 128-bit value consisting of one group of 8 hexadecimal digits, followed by three groups of 4 hexadecimal digits each, followed by one group of 12 hexadecimal digits. The following example GUID shows the groupings of hexadecimal digits in a GUID: 6B29FC40-CA47-1067-B31D-00DD010662DA

DFN: Patient Internal Entry Number.

DIRECT: I(N) or O(UT)

DTC: Date and time of creation.

DTIE: Date and time of import/export (optional). If not supplied then NOW will be used.

DTYE: Document Type – these types are stored within the DSIO IHE DOCUMENT TYPE file and must be within this file to pass validation.

TITLE: Free text of 1 to 100 characters in length.

FAC: Free text of 1 to 50 characters in length.

REC: Free text of 1 to 50 characters in length.

DOC: An array of XML representing the IHE Document.

Output

Success IENS ^ IEN/DFN

Failure -1^Error Message
